JAMOVİ

DATA ENTRY

Abstract: This chapter shows how to enter the data in jamovi, both visually with screenshots and via written instructions. Simple examples for most undergraduate-level between-subjects and within-subjects research designs are provided.

Keywords: jamovi, screenshots, directions for use

Original: July 2017

Updated: January 2025

This document is part of an online statistics sourcebook.

Entering One Sample Data3

Entering Repeated Measures Data.....5

Entering Multiple Sample Data7

Entering Factorial Data9

Entering One Sample Data

Steps for Defining Variables

1. First, click on the “Data” tab on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Click on a cell in the column (i.e., variable) that you wish to define. Click on “Setup” from the menu. This will bring up a new set of options.

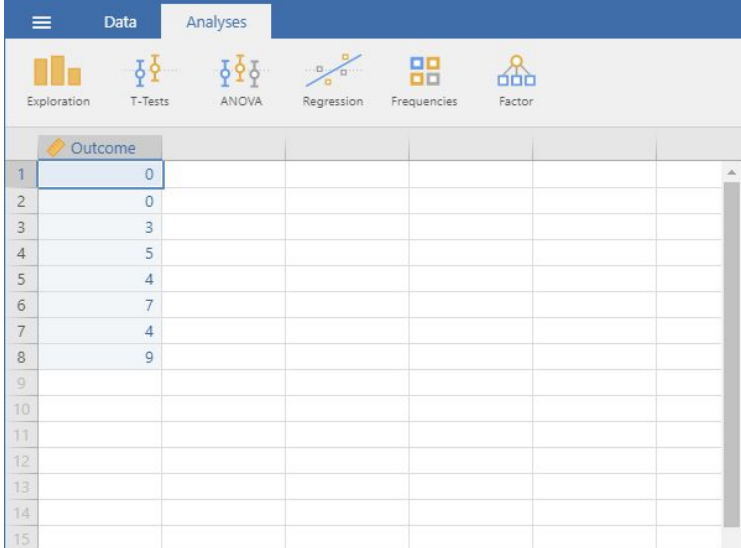

Steps for Setting Variable Properties

3. Type in the name of the variable in the top box (previously labeled “A”).
4. Define the level of measurement for the variables by choosing the appropriate option. In this example, “Outcome” (an outcome variable) is continuous.
5. To hide the setup menu, click on the large UP arrow button to the right of the variable name.

Steps for Entering Data

6. Enter the data in the individual cells of the column for the variable.
Note that each cell should contain a single score for an individual person. There will be as many rows as people.

The screenshot shows a software interface with a blue header bar containing a menu icon, 'Data', and 'Analyses' tabs. Below the header is a row of icons for various statistical tests: Exploration (bar chart), T-Tests (t-distribution), ANOVA (ANOVA diagram), Regression (line graph), Frequencies (bar chart), and Factor (hierarchy diagram). The main area is a data table with a light gray header row labeled 'Outcome'. The first column contains row numbers 1 through 15. The second column contains the following values: 0, 0, 3, 5, 4, 7, 4, 9, and then empty cells for rows 9 through 15. A vertical scrollbar is on the right side of the table.

	Outcome					
1	0					
2	0					
3	3					
4	5					
5	4					
6	7					
7	4					
8	9

Entering Repeated Measures Data

Steps for Defining Variables

1. First, click on the “Data” tab on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Click on a cell in the column (i.e., variable) that you wish to define. Click on “Setup” from the menu. This will bring up a new set of options.

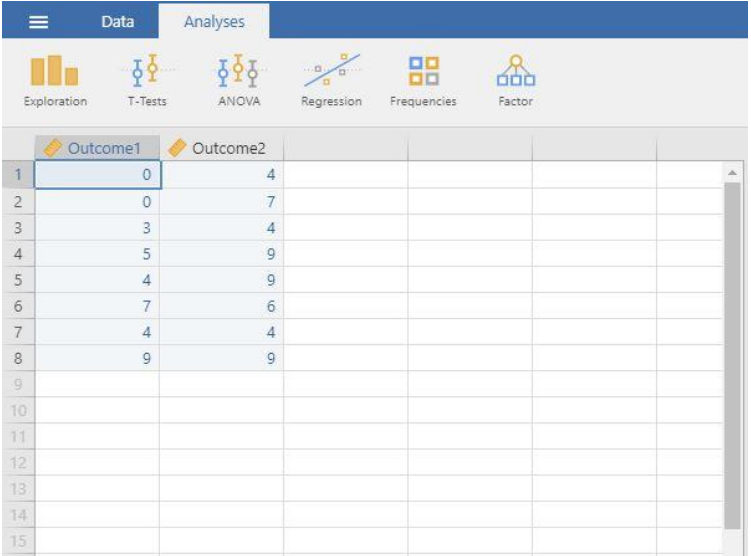

Steps for Setting Variable Properties

3. Type in the name of the variable in the top box (previously labeled “A”).
4. Define the level of measurement for the variables by choosing the appropriate option. In this example, “Outcome1” (an instance of the outcome variable) is continuous.
5. To hide the setup menu, click on the large UP arrow button to the right of the variable name.

Steps for Entering Data

6. Enter the data in the individual cells of the column for the variable. Note that each cell should contain a single score for an individual person. There will be as many rows as people.
7. Notice that each individual (i.e., the rows) have values for each instance of the within-subjects variable (i.e., the columns).

	Outcome1	Outcome2				
1	0	4				
2	0	7				
3	3	4				
4	5	9				
5	4	9				
6	7	6				
7	4	4				
8	9	9

Your data are now ready to be analyzed!

Entering Multiple Sample Data

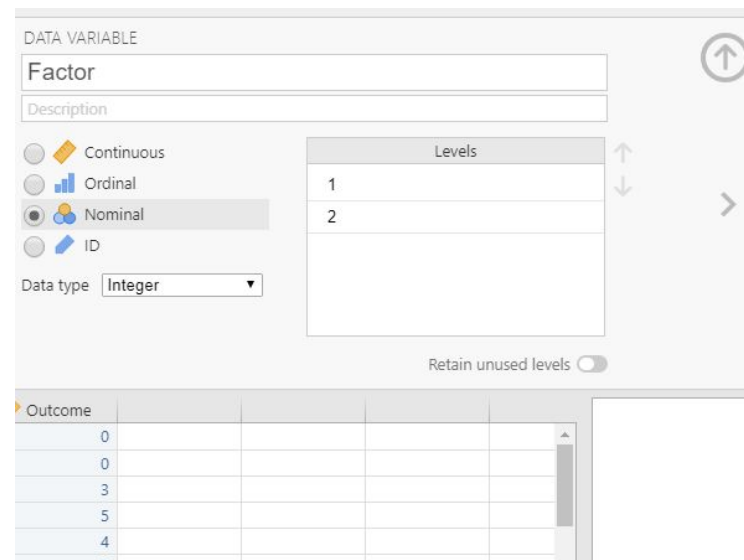

Steps for Defining Variables

1. First, click on the “Data” tab on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Click on a cell in the column (i.e., variable) that you wish to define. Click on “Setup” from the menu. This will bring up a new set of options.

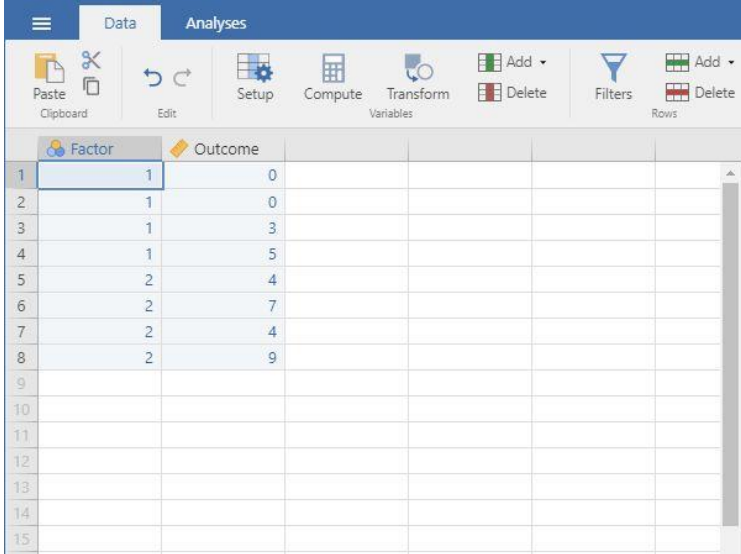

Steps for Setting Variable Properties

3. You will need to define multiple variables. One variable will represent the Factor (Independent Variable) and the other will represent the Outcome (Dependent) Variable.
4. Provide a name and define the level of measurement for the variables by choosing the appropriate options. In this example, “Factor” (Independent Variable) is nominal. The “Outcome” (Dependent) variable is continuous.
5. To hide the setup menu, click on the large UP arrow button next to the variable name.

Steps for Entering Data

6. Enter the data for all of the participants. Notice that each participant has scores on both the Factor and Outcome Variables. There will be as many rows as people.
7. On the categorical “Factor”, you will use numbers to represent the two categories (or “levels”) of the variable.
8. If your data set has more than two groups, simply be sure to add a group indicator (a value on the “Factor” variable) and a “Outcome” for each additional person.

	Factor	Outcome				
1	1	0				
2	1	0				
3	1	3				
4	1	5				
5	2	4				
6	2	7				
7	2	4				
8	2	9

Entering Factorial Data

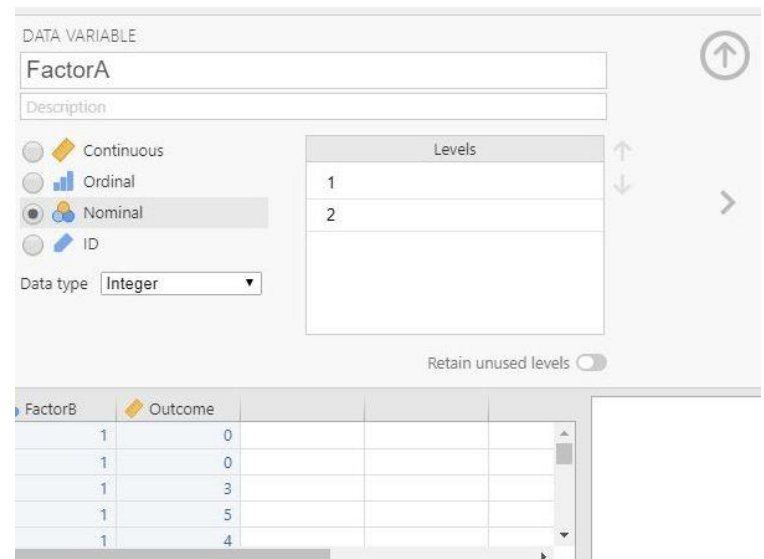

Steps for Defining Variables

1. First, click on the “Data” tab on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Click on a cell in the column (i.e., variable) that you wish to define. Click on “Setup” from the menu. This will bring up a new set of options.

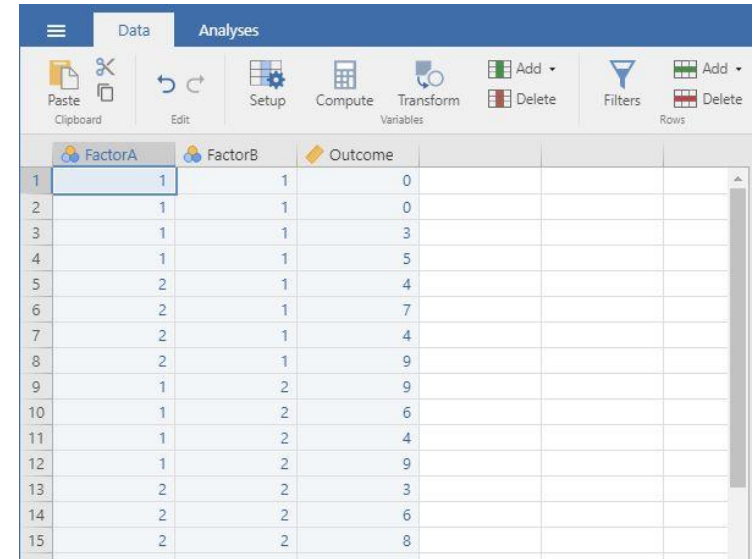

Steps for Setting Variable Properties

3. You will need to define multiple variables. Two variables will represent the Factors (Independent Variables) and the other will represent the Outcome (Dependent) Variable.
4. Provide a name and define the level of measurement for the variables by choosing the appropriate options. In this example, “FactorA” and “FactorB” nominal. The “Outcome” (Dependent) variable is continuous.
5. To hide the setup menu, click on the large UP arrow button next to the variable name.

Steps for Entering Data

6. Enter the data for all of the participants. Notice that each participant has scores on both of the Factors and on the Outcome Variable. There will be as many rows as people.
7. On the categorical Factors, use the values that you indicated when defining the variables earlier. Note that the combination of values in the Factors will define the multiple groups of the factorial design.
8. If your data set has more than two levels for either (or both) of the Factors, simply be sure to add an indicator and an outcome value for each additional person.

The screenshot shows a software interface with a 'Data' tab and an 'Analyses' tab. Below the tabs is a toolbar with icons for 'Paste', 'Clipboard', 'Edit', 'Setup', 'Compute', 'Transform', 'Variables', 'Add', 'Delete', 'Filters', and 'Rows'. The main area is a data table with columns 'FactorA', 'FactorB', and 'Outcome'. The table contains 15 rows of data, with the first row highlighted. The data is as follows:

	FactorA	FactorB	Outcome
1	1	1	0
2	1	1	0
3	1	1	3
4	1	1	5
5	2	1	4
6	2	1	7
7	2	1	4
8	2	1	9
9	1	2	9
10	1	2	6
11	1	2	4
12	1	2	9
13	2	2	3
14	2	2	6
15	2	2	8
