

OneWay ANOVA

Prior to the steps below, enter the data as appropriate for the analyses (described elsewhere). As always, the following commands should be typed directly in the R console window.

Obtaining Descriptive Statistics

Get the grand mean for the variable and the mean and standard deviation for the dependent variable for each of the levels.

```
mean(Outcome)
tapply(Outcome, Factor, function(x) c(length(x), mean(x), sd(x)))
```

Obtaining Inferential Statistics

Get the analysis of variance source table with test of statistical significance.

```
Results <- aov(Outcome~Factor)
summary(Results)
```
