JASP Articles

Data Entry

Abstract: This chapter provides step-by-step written instructions and screenshots showing how to enter the data in JASP. Simple examples for most undergraduate-level between-subjects and within-subjects research designs are provided.

Keywords: JASP, screenshots, directions for use

Original: July 2017

Updated: May 2025

Table of Contents for This Chapter

One Sample Data3

Paired and Repeated Measures Data5

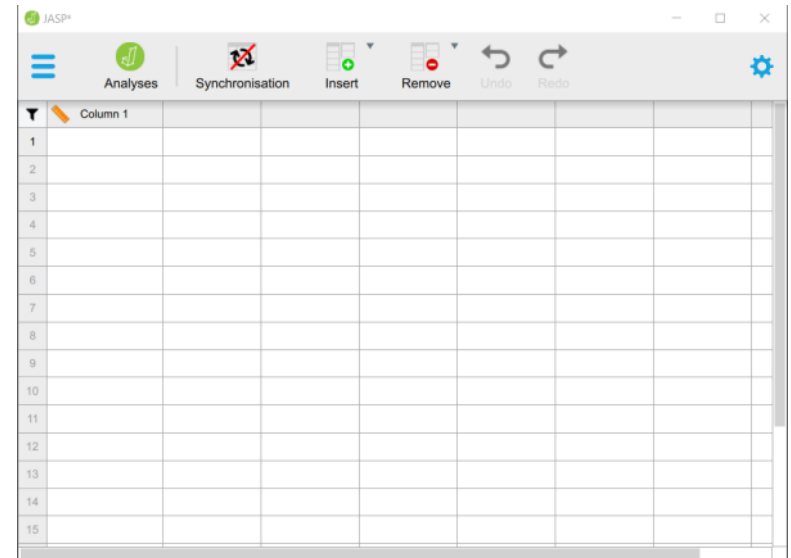

Two and Multiple Sample Data7

Factorial Data9

One Sample Data

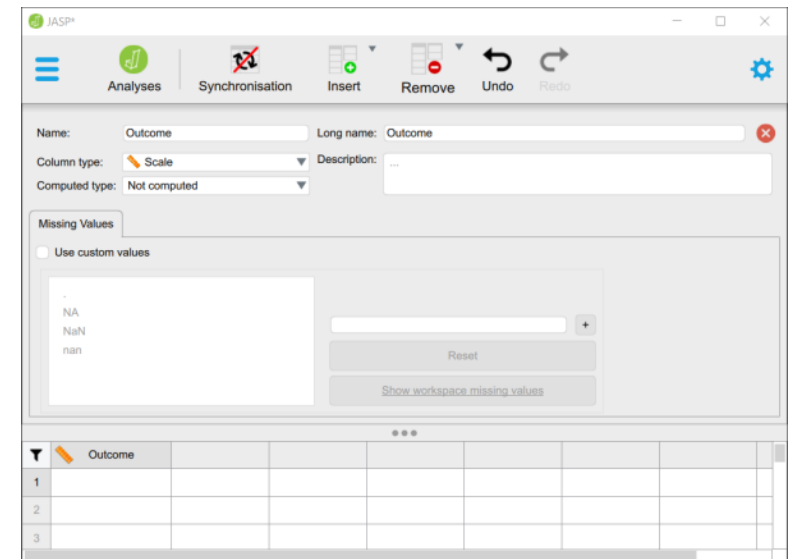

Defining Variables

1. First, click on the “Edit Data” button on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Double-click on a cell column header (i.e., variable) that you wish to define. This will bring up a new set of options.

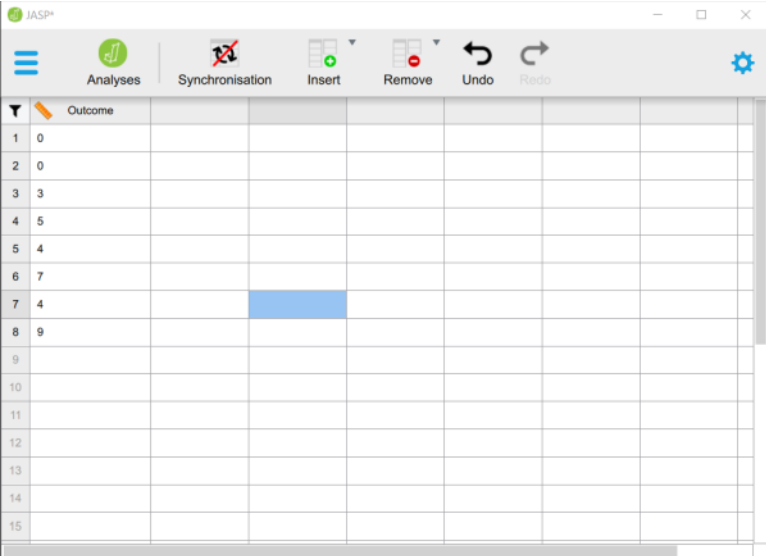

Setting Variable Properties

3. Type in the name of the variable in the top box (previously labeled “A”).
4. Define the level of measurement for the variables by choosing the appropriate option. In this example, “Outcome” (an outcome variable) is continuous (Scale).
5. To close the variable menu, click on the red “x” button to the right of the variable name.

Entering Data

6. Enter the data in the individual cells of the column for the variable. Note that each cell should contain a single score for an individual person. There will be as many rows as people.
7. When done, click on the “Analyses” button on the top of the window.

The screenshot shows the JASP software window. The top toolbar includes buttons for Analyses, Synchronisation, Insert, Remove, Undo, and Redo. The main data table has 15 rows and 7 columns. The first column is labeled 'Outcome' and contains the following scores: 0, 0, 3, 5, 4, 7, 4, 9, and then empty cells for rows 9 through 15. The second column is highlighted in blue.

	Outcome					
1	0					
2	0					
3	3					
4	5					
5	4					
6	7					
7	4					
8	9					
9

15						

Paired and Repeated Measures Data

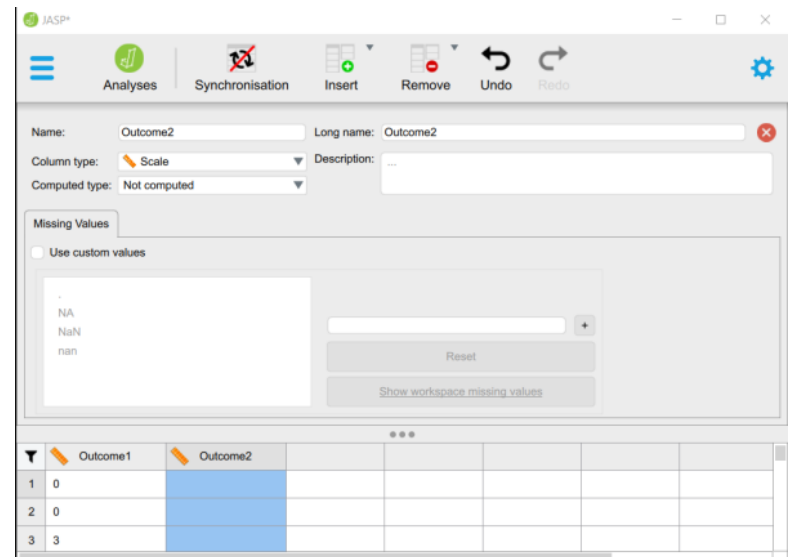

Defining Variables

1. First, click on the “Edit Data” button on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Double-click on a cell column header (i.e., variable) that you wish to define. This will bring up a new set of options.

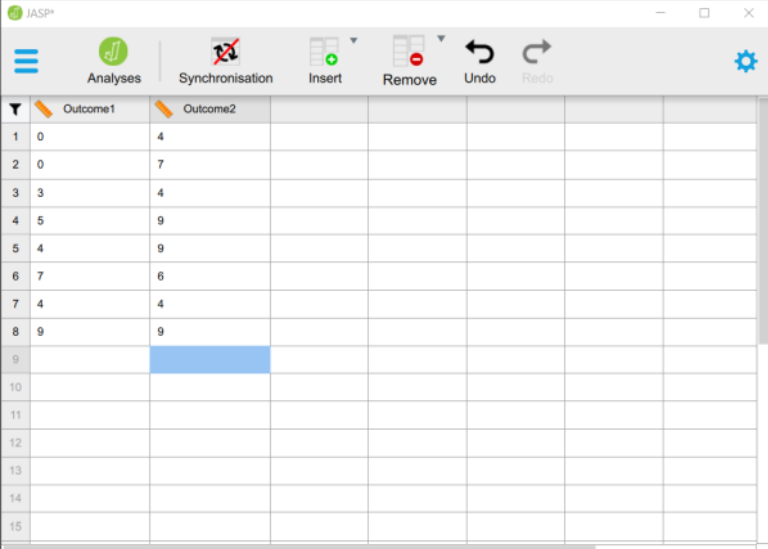

Setting Variable Properties

3. Type in the name of the variable in the top box (previously labeled “A”).
4. Define the level of measurement for the variables by choosing the appropriate option. In this example, “Outcome1” (an instance of the outcome variable) is continuous (Scale).
5. To close the variable menu, click on the red “x” button to the right of the variable name.

Entering Data

6. Enter the data in the individual cells of the column for the variable.
Note that each cell should contain a single score for an individual person. There will be as many rows as people.
7. Notice that each individual (i.e., the rows) have values for each instance of the within-subjects variable (i.e., the columns).
8. When done, click on the “Analyses” button on the top of the window.

	Outcome1	Outcome2				
1	0	4				
2	0	7				
3	3	4				
4	5	9				
5	4	9				
6	7	6				
7	4	4				
8	9	9				
9						
10						
11						
12						
13						
14						
15						

Two and Multiple Sample Data

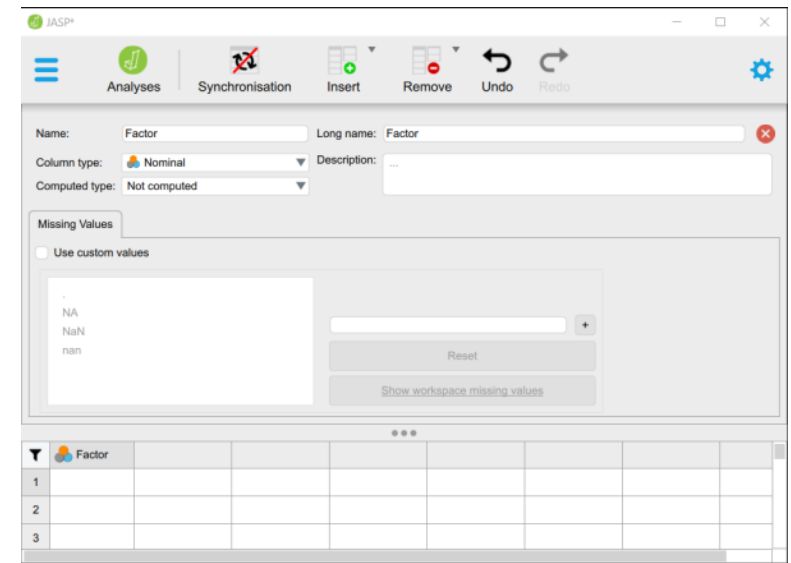

Defining Variables

1. First, click on the “Edit Data” button on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Double-click on a cell column header (i.e., variable) that you wish to define. This will bring up a new set of options.

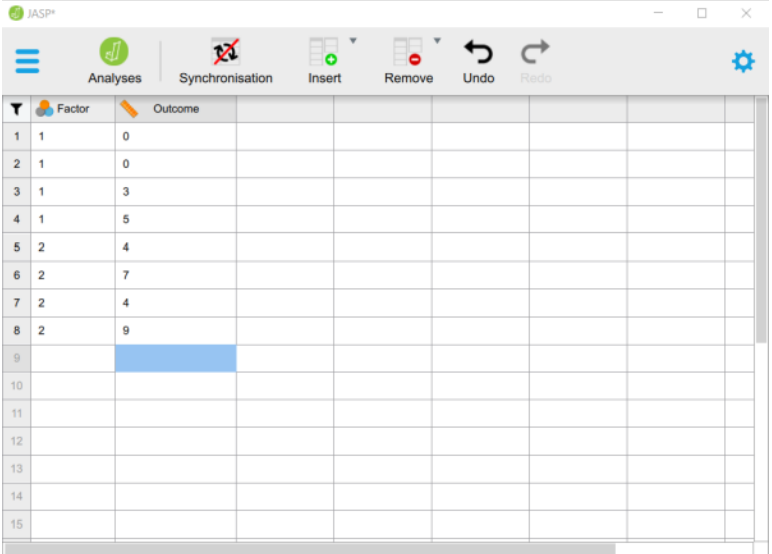

Setting Variable Properties

3. You will need to define multiple variables. One variable will represent the Factor (Independent Variable) and the other will represent the Outcome (Dependent) Variable.
4. Provide a name and define the level of measurement for the variables by choosing the appropriate options. In this example, “Factor” (Independent Variable) is nominal. The “Outcome” (Dependent) variable is continuous (Scale).
5. To close the variable menu, click on the red “x” button next to the variable name.

Entering Data

6. Enter the data for all of the participants. Notice that each participant has scores on both the Factor and Outcome Variables. There will be as many rows as people.
7. On the categorical “Factor”, you will use numbers to represent the two categories (or “levels”) of the variable.
8. If your data set has more than two groups, simply be sure to add a group indicator (a value on the “Factor” variable) and a “Outcome” for each additional person.
9. When done, click on the “Analyses” button on the top of the window.

The screenshot shows the JASP software interface. At the top, there is a menu bar with icons for Analyses, Synchronisation, Insert, Remove, Undo, and Redo. Below the menu bar is a data table with two columns: Factor and Outcome. The table contains 15 rows of data. The Factor column has values 1, 2, 1, 1, 2, 2, 2, 2, and the Outcome column has values 0, 0, 3, 5, 4, 7, 4, 9. The row with Factor=2 and Outcome=9 is highlighted in blue.

	Factor	Outcome
1	1	0
2	1	0
3	1	3
4	1	5
5	2	4
6	2	7
7	2	4
8	2	9
9		
10		
11		
12		
13		
14		
15		

Factorial Data

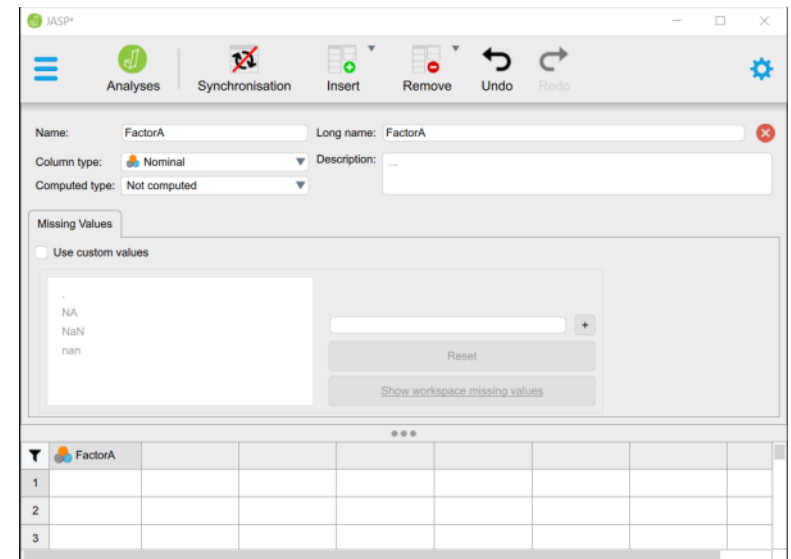

Defining Variables

1. First, click on the “Edit Data” button on the top of the window. Generally speaking, this is where you will enter the data for all of the variables in the data set.
2. Double-click on a cell column header (i.e., variable) that you wish to define. This will bring up a new set of options.

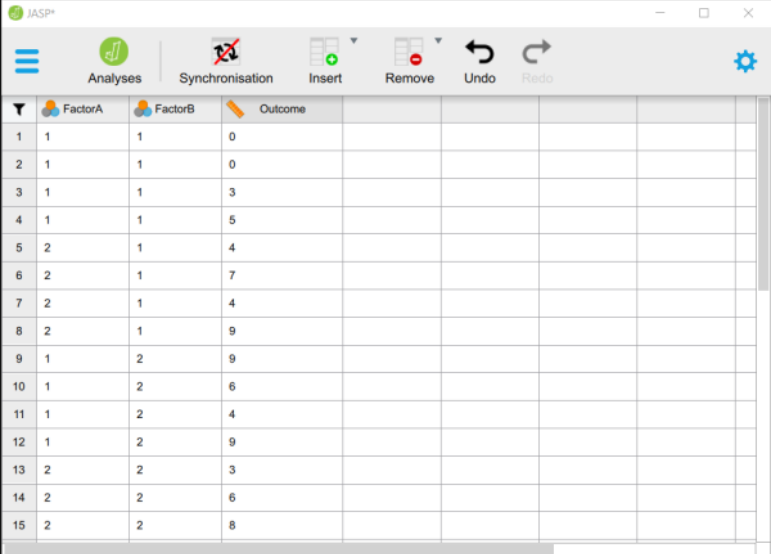

Setting Variable Properties

3. You will need to define multiple variables. Two variables will represent the Factors (Independent Variables) and the other will represent the Outcome (Dependent) Variable.
4. Provide a name and define the level of measurement for the variables by choosing the appropriate options. In this example, “FactorA” and “FactorB” nominal. The “Outcome” (Dependent) variable is continuous (Scale).
5. To close the variable menu, click on the red “x” button next to the variable name.

Entering Data

6. Enter the data for all of the participants. Notice that each participant has scores on both of the Factors and on the Outcome Variable. There will be as many rows as people.
7. On the categorical Factors, use the values that you indicated when defining the variables earlier. Note that the combination of values in the Factors will define the multiple groups of the factorial design.
8. If your data set has more than two levels for either (or both) of the Factors, simply be sure to add an indicator and an outcome value for each additional person.
9. When done, click on the “Analyses” button on the top of the window.

The screenshot shows the JASP software interface. The top menu bar includes buttons for Analyses, Synchronisation, Insert, Remove, Undo, and Redo. Below the menu bar is a data table with 15 rows and 4 columns. The columns are labeled FactorA, FactorB, Outcome, and an empty column. The data is as follows:

	FactorA	FactorB	Outcome	
1	1	1	0	
2	1	1	0	
3	1	1	3	
4	1	1	5	
5	2	1	4	
6	2	1	7	
7	2	1	4	
8	2	1	9	
9	1	2	9	
10	1	2	6	
11	1	2	4	
12	1	2	9	
13	2	2	3	
14	2	2	6	
15	2	2	8
